Things to Know

Status: ☐ Colonization/Screening or ☐ Clinical Specimen

Place of Diagnosis: _____ Date of Diagnosis: _____

C. auris is a yeast that can spread between patients in healthcare settings.

C. auris spreads mainly through contact with contaminated hands, surfaces, and shared medical equipment.

A person may carry *C. auris* on their skin or body without feeling sick. This is called **colonization**. Colonized and infected patients can both spread it.

People may remain colonized for a long time. Tell healthcare providers about this result during all future visits.
